PROFESSIONAL SUMMARY

Senior security engineer (5+ years) specializing in AppSec, DevSecOps, and cloud security, with a track record of turning one-off security engineering into repeatable security platform capabilities. Designed and built a reusable ASPM / security-orchestration platform — not a one-off pipeline — integrating CI/CD security, native SAST/reachability analysis, and supply-chain intelligence into one correlated findings workflow. Grounded in hands-on AppSec delivery (SAST, DAST, SCA, secure code review, penetration testing) and cloud security (AWS, GCP) from 4 years at a leading global IT & business consulting firm (banking/financial-services clients, PCI-DSS) before moving into platform/architecture work.

WORK EXPERIENCE

Senior Cloud Security Engineer

Feb 2026 – Present

AI Product Division, Global Enterprise Technology & Digital-Transformation Group · internal transfer · Hyderabad, India

- Designed and engineered a reusable ASPM / security-orchestration platform that integrates CI/CD security, SCA, secrets detection, container security, SBOM/supply-chain intelligence, and cloud/IaC/DAST/mobile/runtime signal into one correlated, SLA-tracked findings workflow with a normalized cross-scanner finding model — architected as a reusable platform capability, not a one-off pipeline.
- Designed security gating as an enablement mechanism: enforced defined high-risk conditions while routing lower-risk findings into tracked, SLA-bound remediation — reduced the severity profile of open findings across four supported projects from blocker/high/critical toward predominantly low/medium within under a year, with no release-SLA exceptions.
- Designed and implemented dynamic application onboarding (repository discovery → configuration → pipeline provisioning → evidence ingestion) as one repeatable workflow; diagnosed and resolved a production deployment-architecture defect by redesigning persistence around a dedicated project-configuration store instead of disposable pipeline-orchestrator state.
- Developed and benchmarked a native SAST and reachability-analysis engine — explainable source-to-sink analysis, bounded interprocedural reachability, cross-file resolution — validated at 100% precision/recall against a 62-fixture regression corpus; designed (architecture complete, implementation in progress) a hybrid AI-assisted SAST layer where deterministic analysis constrains candidates and local AI adds validated contextual reasoning.
- Extended the platform's security signal across DAST, mobile application testing, IaC scanning, runtime behavioral detection, and container/Dockerfile hardening on AWS and GCP, advancing CI/CD pipelines toward an advanced DevSecOps Security Maturity Model (DSOMM) level.
- Defined security controls for AI-enabled products (data protection, API security, model integrity, secure AI-assisted coding) and established security KPI / compliance reporting dashboards for stakeholder-facing risk visibility.

Senior Consultant – Cloud & Application Security

Sep 2025 – Jan 2026

Global Enterprise Technology & Digital-Transformation Services Company · Hyderabad, India (promoted to the company's AI product division in Feb 2026)

- Architected and governed cloud security controls across multi-client AWS and GCP environments, translating security requirements into practical, engineering-first controls.
- Designed DevSecOps frameworks aligned with OWASP DSOMM, NIST SP 800-53, and Zero Trust Architecture, embedding automated security gates into software delivery lifecycles.
- Drove compliance readiness and audit support through continuous security assurance pipelines, vulnerability SLA enforcement, and automated audit-trail generation.

Application Security Engineer

Oct 2021 – Sep 2025

Leading Global IT & Business Consulting Firm · banking & financial-services clients, PCI-DSS · Hyderabad, India

- Executed penetration testing, SAST (Checkmarx), DAST (OWASP ZAP), SCA, and secure code reviews across large-scale enterprise applications, identifying and remediating critical vulnerabilities.
- Integrated Checkmarx and OWASP ZAP into CI/CD pipelines; coached development teams on OWASP Top 10 remediation, measurably reducing recurring vulnerability patterns across release cycles.
- Deployed and managed IAM solutions (Okta, Delinea) enforcing least-privilege access and MFA across enterprise environments, reducing unauthorized-access risk.
- Operated Splunk SIEM for security event correlation, alert triage, and threat investigation, improving mean time to detect (MTTD) across monitored applications and infrastructure.

SKILLS

Application Security: SAST · SCA · DAST · SAST/Reachability Analysis · Secure Code Review · Penetration Testing · OWASP ASVS/Top 10

DevSecOps: Jenkins · GitHub Actions · GitLab · CI/CD Security Gates · SBOM (CycloneDX) · Docker · Kubernetes · IaC Scanning

Security Platform / ASPM: Finding Normalization & Correlation · Dependency-Track · DefectDojo · Security Evidence & Audit Automation · Policy-Based Gating

Cloud Security: GCP (VPC · IAM · Cloud Logging · Security Command Center) · AWS (GuardDuty · Inspector · Macie · Security Hub · IAM · Config · Lambda · EventBridge) · Zero Trust

Additional: Checkmarx · SonarQube · Gitleaks · Trivy · Falco · Burp Suite · Nessus/Tenable.io · Metasploit · Nmap · Okta · Delinea · Splunk SIEM · Python · Java · JavaScript · SQL · Bash

SELECTED PROJECTS

Security Orchestration / ASPM Platform — *private implementation; public architecture + POC evidence*

Centralized application/service security posture, CI/CD security integration, correlated findings, supply-chain intelligence, and vulnerability lifecycle management into one reusable platform capability.

Public POC repo: github.com/deepakguntoju/security-enablement-platform-poc

AWS Threat Detection & Auto-Response

Cloud infrastructure threat-detection and auto-response automation (GuardDuty, Inspector, Macie, Security Hub, Lambda, EventBridge) — real-time, serverless remediation of infrastructure-layer threats; a distinct automation model from the ASPM platform's human-approved application-remediation approach.

github.com/deepakguntoju/aws-threat-detection-and-auto-response

TPOT Honeypot for Threat Intelligence on GCP

Deployed TPOT on GCP integrating Suricata, Cowrie, and Dionaea — capturing real-world adversary behaviour and extracting actionable threat intelligence.

github.com/deepakguntoju/TPOT-Honeypot-Security-Analysis

Full-Scope VAPT Lab

Vulnerability Assessment & Penetration Testing across web applications, APIs, network infrastructure, and container environments, producing detailed remediation reports.

EDUCATION & CERTIFICATIONS

Bachelor of Engineering – Electronics & Communication Engineering

Osmania University, Hyderabad, India · 2021

Certifications

- Google Cloud Certified – Professional Cloud Security Engineer (2026)
- Ethical Hacking: Mobile Platform & Network Architecture
- AccessData Certified Investigator (ACI) – Mobile Application Security
- Advanced Cyber Security: Threats and Governance
